# What can we learn from how cyanobacteria are managed globally?

**T John Verhoeven  
Stuart J Khan  
Megan C Evans**

**26-27 September 2023**

# Significant problem research aim?

Toxic cyanobacteria are a significant increasing global problem

Aim: how can governments and communities more effectively respond to the significant problem of cyanobacteria?

# Methods: why international collaboration?

Literature review identified research problem, 3 research gaps

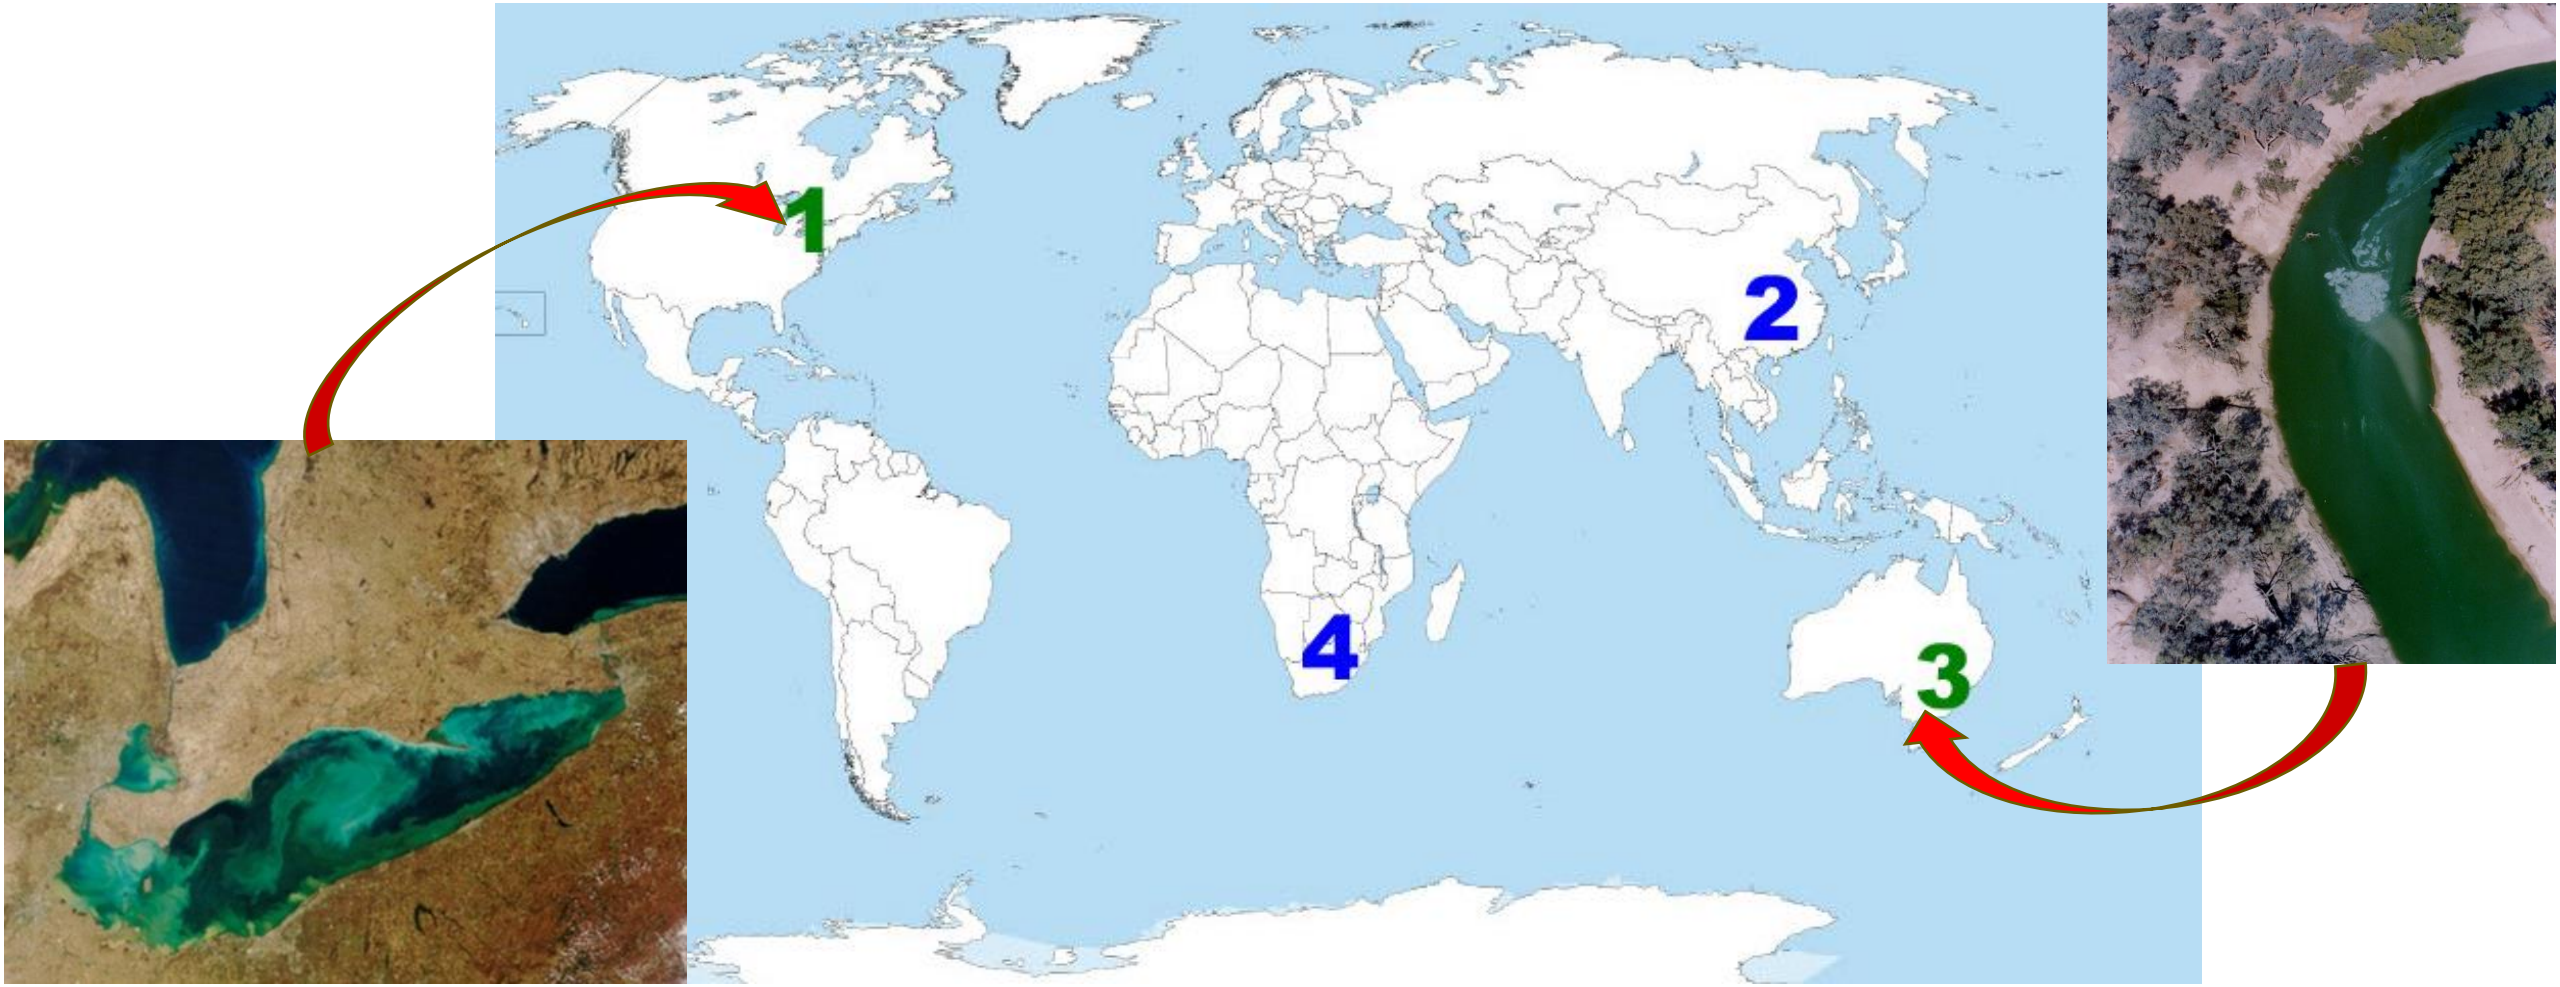

High-level global assessment of cyano management

Analyse four cases as part of qualitative methodology

# Results from cases on 4 continents?

# Conclusions: are research gaps closed?

Watch for integrated multi-management approaches operating at multi-geographic scales:

- ➔ Use integrated processes to minimise bloom causes
- ➔ Use policy and institutional arrangements
- ➔ Address compounding climate change, rising CO<sub>2</sub> and other anthropogenic impacts
